0 I'm looking to create a state of uninterruptible sleep for a program I'm writing. Any tips or ideas about how to create this state would be helpful. So far I've looked into the ...

An uninterruptible process is a process which happens to be in a system call (kernel function) that cannot be interrupted by a signal. To understand what that means, you need to understand ...

As you could read from that answer, setting the current process state to TASK\_UNINTERRUPTIBLE is needed for make schedule() call, performed by that thread, to ...

For Linux "defunct" and "zombie" processes are the same. From man ps: Processes marked &lt;defunct&gt; are dead processes (so-called "zombies") that remain because ...

I have a VirtualBox process hanging around which I tried to kill (KILL/ABORT) but without success. The parent pid is 1 (init). top shows the process as D which is documented as ...

Yes, you must call set\_current\_state() before calling schedule(), because otherwise the scheduler will not remove the task from the run queue (if you just want to ...

When looking at the process with "ps ax" the stat column is "Dl" which means "uninterruptible sleep (usually IO)". Is it possible to find out more details on what the process is ...

I understand these are uninterruptible sleep states often related to waiting for data from hardware such as a hard disk. This is a production server so rebooting is a very last ...

A process performing I/O will be put in D state (uninterruptable sleep), which frees the CPU until there is a
